This lecture: Exponential distribution

Exponential distribution

Def: We call X an exponential random variable (rv), with parameter $\lambda > 0$, i.e., $X \sim \underline{\triangleright_{X}(\lambda)}$, if X has density:

$$f(x) = \begin{cases} \lambda e^{-\lambda x} & \times > 0 \\ 0 & \times < 0 \end{cases}$$

T(X)

Exponential random variables often model <u>Waiting times</u>

Warm-up

Let $X \sim Exp(\lambda)$.

What is
$$P(X > t)$$
?
$$P(X > t) = P(X > t) = \begin{cases} P(X > t) = e^{-\lambda x} \\ f(X > t) = e^{-\lambda x} \end{cases}$$

$$P(X > t) = P(X > t) = 0$$

What is $\mathbb{E}X$?

What is
$$\mathbb{E}X$$
?

$$\mathbb{E}X = \int_{0}^{\infty} P(x \ge t) dt = \int_{0}^{\infty} e^{-\lambda t} dt = \frac{1}{1} e^{-\lambda t} \int_{0}^{\infty} e^{-\lambda t} dt = \frac{$$

Properties of exponential rv's

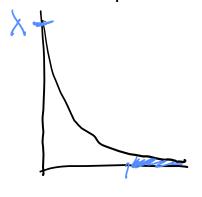

Fact: Let $X \sim Exp(\lambda)$. Then,

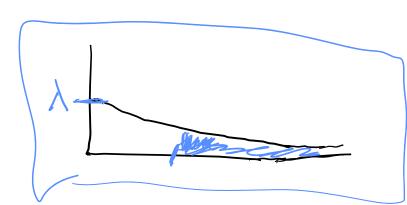

•
$$\mathbb{E}X =$$

•
$$Var(X) = \frac{1}{X^2}$$
 Exercize for you

$$P(X > t) = P(x > t) = C^{\lambda t}$$

Which exponential density gives higher expectation value?

Llorger expected
Value

Example) Suppose $T \sim Exp\left(\frac{1}{10}\right)$ is the time you have to wait for the bus. Given that you have been waiting for 20 minutes, what is the chance that the bus comes within the next 10 minutes? On average, how much longer must you wait?

$$P(T \in [20, 30] | T \ge 20) = P(\{T \in [20, 30]\} \notin \{T \ge 20\})$$

$$= P(T \in [20, 30]) = P(\{T \ge 20\}\} (\{T \ge 20\}\}) = P(T \ge 20) - P(T \ge 30)$$

$$= P(T \ge 20) = P(T \ge 20) = P(T \ge 20)$$

$$= e^{-\frac{1}{10} \cdot 20} - e^{-\frac{1}{10} \cdot 30} = 1 - e^{\frac{1}{10} \cdot 20} - \frac{1}{10} \cdot 30 = 1 - e^{-\frac{1}{10}}$$

$$B$$

Nolice:
$$P(b_0)$$
 comes in let 10 min
= $P(T \in [b, 10]) = 1 - P(t = 10) = 1 - E = [1 - e^{-1}]$

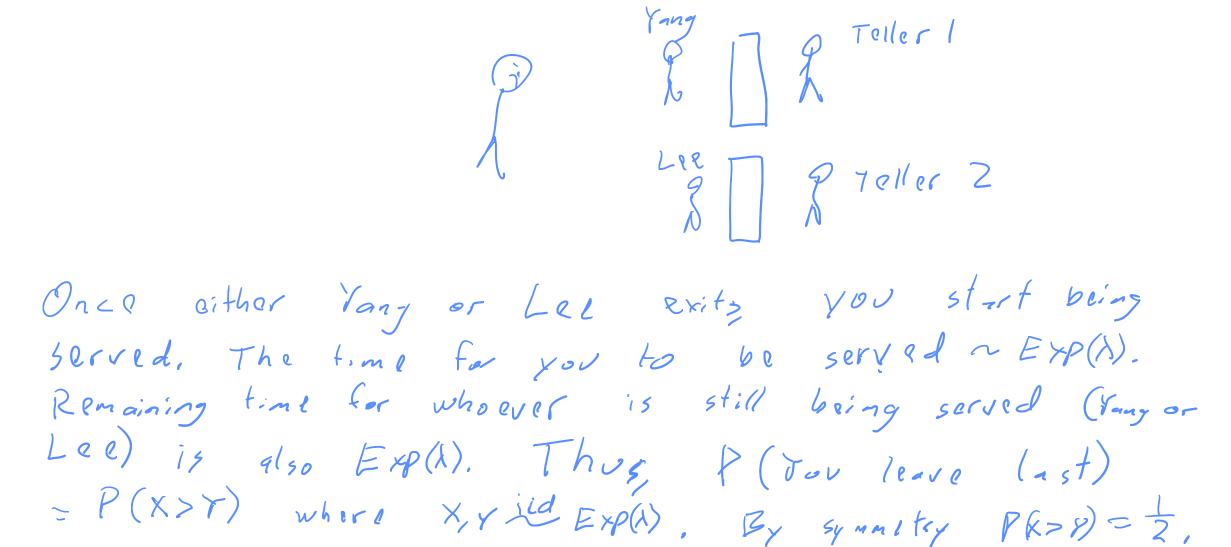

Memorylessness

Prop: Let
$$X \sim Exp(\lambda)$$
. Then,
$$P(X \ge t + s | X \ge s) = P(X \ge t)$$

Q)
$$P(X < t + s | X \ge s) = P(X < t)$$

 $E[X - s | X \ge s] = E[Exp(X)] = \frac{1}{X}$

Example) You enter a bank which has two tellers, currently servicing Yang and Lee. Service times are iid $Exp(\lambda)$. What is the chance you leave last?

Minimum of two exponential rv's

Q) Suppose $X \sim Exp(\lambda_1)$, $Y \sim Exp(\lambda_2)$ are independent. What is the distribution of $Z = \min(X, Y)$?

Fastest to finish

Q) Let $X \sim Exp(\lambda_1)$, $Y \sim Exp(\lambda_2)$. What is P(X < Y)?

Ex)
$$\lambda_1 = 1$$
, $\lambda_2 = 2$. Symmetry argument:
Note: $Y \stackrel{dist}{=} min(\Gamma_1, \Gamma_2)$ $\Gamma_1, \Gamma_2 \stackrel{iid}{=} E \times p(1)$
 $P(X < Y) = P(X < min(\Gamma_1, \Gamma_2)) = (*)$ Note $X_1, Y_2, Y_3 \stackrel{iid}{=} E \times p(1)$
The chance of any given ordering is the same
 $(*) = \frac{1}{3} = \frac{1}{16} = \frac{1}{16} = \frac{1}{16} = \frac{1}{16}$

$$P(X < Y) = \iint_{X < Y} \lambda_{1} e^{-\lambda_{1} X} \cdot \lambda_{2} e^{-\lambda_{2} Y} dy dx$$

$$= \int_{0}^{\infty} \int_{X}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot \lambda_{2} e^{-\lambda_{2} Y} dy dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} P(Y > X) dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

$$= \int_{0}^{\infty} \lambda_{1} e^{-\lambda_{1} X} \cdot e^{-\lambda_{2} X} dx$$

Q) You enter a bank which has two tellers, currently servicing Yang and Lee. Service times are iid $Exp(\lambda)$. What is the expected time until you are finished being served?
